## Forward

It gives me great pleasure in presenting the Forward for the Canadian Well Logging Society's Fourth Edition of the Formation Water Resistivities of Canada which is known as the "**CWLS Rw Catalog**". In 1998, the CWLS executive decided that the Rw Catalog required updating, not only because of the large amount of new data available since the last edition, but mainly because of advances in computer technology which have facilitated the presentation of larger volumes of data.

The CWLS Executive would like to acknowledge the contributions of International Petrodata and the North Dakota Geological Survey for access to their water geochemistry databases. Also, our appreciation and thanks go to the editors, Pat Miller and Bob Menard, for the countless hours preparing and editing the new edition. The days of working on society projects during working hours are long gone and therefore the CWLS Executive would like to acknowledge the fact that all the work editing the Rw Catalog was done exclusively on the editor's personal time. Additional thanks to the members of the Rw Committee who assisted in checking and verifying the data.

The Rw Catalog is published as a reference volume for all people engaged in log interpretation. Any comments would be greatly appreciated and should be directed to the Chairman of Committees in care of the CWLS office.

February, 2002

Mark Ducheck  
CWLS Chairman of Committees

## Preface

The idea for a formation water resistivity catalog began circa 1964 when Schlumberger of Canada published the first Rw Catalog for their field engineers. Prior to that, most major oil companies each had their own collections of Rw Data. The 1964 edition was so popular that it was expanded and revised in 1966. In 1971, the CWLS published their first formation water catalog based on Schlumberger's previous works. This was followed by updates in 1978 and 1987.

The 2002 Edition of the Rw Catalog has taken almost four years to complete. The objectives of the update:

1. Add new values (new areas and new wells)
2. Correct known errors
3. Append additional information (formation and interval)
4. Establish a procedure to facilitate updates
5. Publish electronically

The 2002 Rw Catalog update contains significantly more information than the previous editions. As with previous editions, the CWLS publication "Formation Water Resistivities of Canada" (Rw Catalog) was published to assist log analysts by providing reliably edited Rw values to improve the accuracy of water saturation calculations.

The most significant change presented in the 2002 Edition of the Rw Catalog is the fact that the data was not culled to reduce the density of the data, which was a limitation of the "printed page" presentation of the previous versions of the Rw Catalog. The 2002 Edition of the Rw Catalog, in a CD ROM format, includes all data that met screening criteria. The following table illustrates the increase in data available in the new edition:

Number of Samples	Available	Met Criteria	Presented
1987 Edition	81,000	40,000	5,600
2002 Edition*	87,650	45,900	45,900

\* Canadian data only (does not include 3,569 samples from North Dakota presented in 2002 Edition).

International Petrodata Ltd. has made available to the CWLS a computer database of water analyses for Canada (excluding Ontario and Quebec). This database included both samples from drillstem and production tests (the 1987 edition only included drillstem test data). In January 2002, the North Dakota Geological Society generously allowed the Canadian Well Logging Society to publish their data in the 2002 Edition of the Rw Catalog.

The initial screening process was performed by the International Petrodata Ltd. where they reduced their database to approximately 87,650 by eliminating samples with a pH value below 5.2 and greater than 8.4 which should eliminate most waters contaminated by acid and mud filtrate, respectively. Further screening was done based on input from Susan Johnson of Opus Petroleum Engineering. Samples were eliminated if the

potassium ion concentration was greater than the sodium ion concentration, indicative of KCL mud filtrate contamination. The presence of CO<sub>3</sub> ions is normally associated with mud filtrate contamination and therefore all samples containing any amount of CO<sub>3</sub> ions were also eliminated. Values representing more than one major formation water were also eliminated. Measured resistivity values were corrected to 25 Degrees Celsius, samples without measured (only calculated water resistivities) were also eliminated.

The data was further screened by applying formation specific limits to the pH, ion ratio and Sodium / Chloride ratio. Mapping techniques and statistically determined resistivity cutoffs were also used employed to screen the data. For the first time, in the 2002 Edition of the Rw Catalog, the samples are being identified as either normal formation water or fresh water recharge water samples. These screening procedures are implemented by queries in a Microsoft Access database. New data can easily be filtered through the same screening process.

There were several publication formats investigated. The objective was to create a low-cost, stand-alone product. There are some very interesting interactive technologies available but they required expensive licensing and/or an internet connection. The compromise solution was to use GIS software to generate maps of the data in PDF format for publishing in the 2002 Edition of the Rw Catalog. It is expected that future editions will include a more sophisticated graphic user interface and will be available on the CWLS website. It is also hoped that formation water data can be located for Ontario and Quebec, for the next edition of the Rw Catalog.

Although every attempt was made to eliminate erroneous Rw values, some have probably been included in the 2002 Edition of the Rw Catalog. The user is therefore cautioned to use this catalog as a guide only. No guarantee can be made as to the accuracy of the values presented, or to the correctness of the geological corrections applied to the data. With the increase in data available to the log analyst, it is suggested that additional “reasonable” statistical methods be applied to derive a representative water resistivity prior to performing water saturation calculations.

## 2002 Layer – 87 Map Equivalents

<b>Western Basin</b>	
<b>Layer</b>	<b>Corresponding 87 CWLS Maps</b>
1	1 (Tertiary & U. Cret.)
2	2 & 21 (Upper Cretaceous)
3	3 & 22 (Lower Cretaceous)
4	4 & 23 (Lower Cretaceous)
5	5 & 6 & 24 (Lower Cretaceous)
6	7, 25, 26, 27 & 28 (Jurassic)
7	8 (Triassic not present in SK/MB)
8	9 (Permian & Pennsylvanian not present in SK/MB)
9	10, 11, 12, 29, 30, 31 & 32 (Mississippian)
10	13, 14, 15 & 33 (Upper Devonian)
11	16, 17, 18 & 34 (Upper & Middle Devonian)
12	19, 20, 35, 36 & 37 (Devonian, Silurian, Ordovician & Cambrian).

<b>North</b>	
<b>Layer</b>	<b>Corresponding 87 CWLS Maps</b>
21	38 & 45 (Tertiary)
22	39, 40, 46 & 47 (Cretaceous)
23	41, 48 & 49 (Jurassic)
24	50 (Triassic present but not reported for YT/NWT in 87 Catalog)
25	42 & 51 (Permian, Pennsylvanian & Mississippian)
26	43, 44, 52 & 53 (Devonian)
27	None (Silurian, Ordovician, Cambrian present but not reported in 87 Catalog)

<b>East Coast</b>	
<b>Layer</b>	<b>Corresponding 87 CWLS Maps</b>
41	54 Tertiary
42	55 Upper Cretaceous
43	56 Lower Cretaceous
44	57 Jurassic

# Acknowledgements

The Canadian Well Logging Society would like to express their gratitude to the following organizations for their contribution to the journal:

## **International Petrodata Ltd:**

IPL supplied the Canadian water geochemistry samples in digital form. This update and the 1987 Edition of the CWLS Rw Catalog would not have been possible without their kind contribution. Brad Dick pre-screened the data and ensured that it met our data format requirements.

## **Opus Petroleum Engineering Ltd:**

Susan and Richard Johnson supplied in-house instruction on the technical aspects of water geochemistry. Susan was a very valuable source of information as the project progressed, answering our numerous questions.

## **The North Dakota Geological Survey:**

The CWLS would like to formally thank John Bluemle and Tom Heck, at the NDGS, for their kind permission to publish NDGS water resistivity data. The North Dakota data will be very useful for CWLS members who work the Williston Basin on both sides of the "49<sup>th</sup> Parallel".

The following members of the Rw Committee assisted in production of the catalog. These people checked water resistivity data, supplied knowledge in the fields of geology, water analysis and computer graphics applications. They also made many helpful suggestions.

Dan Boutin	Anadarko Canada Corporation
Mike Cheng	Nexen Inc.
Ted Connolly	Etcetra Consulting Ltd.
Dwayne DuBourdieu	Reeves Wireline
Jim Earley	AEC Oil & Gas
Grant Ferguson	Baker Atlas
Don Gordon	D & S Reservoir Engineering Ltd.
Susan Johnson	Opus Petroleum Engineering Ltd.

Bruce McFadzean	Burlington Resources Canada Energy Ltd.
Chris Pan	Core Lab
Steve Peach	Schlumberger Wireline & Testing
Jon Sliwinski	Tucker Wireline Services Canada Inc.
Mike Stadnyk	Talisman Energy Inc.
Case Struyk	KC Petrophysics

We feel that we have achieved the majority of our objectives. The most disappointing part of updating the Rw Catalog, for the committee, has been the amount of time that it has taken. This is a combination of:

1. The new environment where most of the committee are consultants and don't enjoy the support of a major organization
2. The learning curve for the technology used

Special thanks to the following individuals that also played a role in the production of the 2002 update of the CWLS publication "CWLS Rw Catalog":

**Case Struyk**

In addition to being a committee member, as the previous editor Case was very helpful in scoping out the project and passing on "the learnings" of the previous committee.

**Mark Ducheck,**

The Chairman of Committees, was persistent at making sure that the committee stayed on task.

## Geochemical Screening of Water Samples

We at Opus Petroleum Engineering Ltd. are honored to have been asked to serve as advisors to the CWLS Rw Committee while they worked on this new version of the CWLS Resistivity Catalog. We were pleased to help out by providing training to the data screeners and by attending meetings over the last two years. However, we cannot take credit for the work or the results. In fact, due to the conflict of interest with our own publication, "Formation Waters of Western Canada", we specifically asked not to be given a copy of the raw data and we have not seen the screened data.

The screening of the data was a very difficult task for the CWLS volunteers. The sheer volume of data was daunting and determining which water samples are truly formation water was not always easy. Both formation waters and mud filtrate recoveries can range from 500 ppm to over 300,000 ppm and a full 40% of the water recoveries are mixtures of the two. Some of the most saline recoveries are spent acid.

The committee has asked us to share some of our knowledge of this subject with you but we are reluctant to give you a mini course for two reasons:

1. A little knowledge is a dangerous thing and
2. If we could teach you how to do it so quickly and easily, you would have no reason to take our wonderful course, "Practical Water Analysis Interpretation".

But, if you are looking at a water analysis and trying to decide whether you can use it for your Rw work, here are a few generalizations that could help.

1. Mg/l and ppm are approximately the same thing except in very saline waters.
2. Most gel-chem mud filtrates are usually from 3000 to 8000 mg/l TDS.
3. When the log header says gel-chem mud, they might mean gyp'ed-up mud. Gyp'ed-up mud usually has soda ash added to compensate for drilling through anhydrites. Gyp'ed-up mud filtrates are usually from 10,000 to 25,000 mg/l TDS.
4. KCl mud filtrates are usually from 30,000 to 50,000 mg/l TDS with lots of K and lots of Cl.
5. Potassium Sulphate mud filtrates are usually from 50,000 to 80,000 mg/l TDS with lots of K and lots of SO<sub>4</sub>.
6. Salt-saturated mud filtrates are usually 300,000 mg/l or higher.
7. Generally speaking, formation waters increase in salinity with depth but see #12.
8. Each zone should have a unique formation water "fingerprint" or Stiff Diagram unless it is hydraulically connected to another zone.
9. This formation water "fingerprint" may change with location in the Alberta basin.
10. Most formation waters in the Alberta basin have a milli-equivalent Na/Cl ratio of 0.6 to 1.2.
11. Many formation waters are fresher than expected as they are affected by fresh water recharge from the surface. These recharge waters have a distinctive fingerprint which is high in bicarbonates and the milli-equivalent Na/Cl ratio is

- usually between 2 and 3. These fresh waters have been found in formations as deep as the Devonian and can under-run more saline formation waters.
12. Never rely on one water analysis as being representative of the formation water in a particular pool and field. Try to find at least three water samples in your pool that have formation water characteristics, are close to the same TDS and have similar “fingerprints”. Then compare the Rw on your samples to the ones in this catalog.

The CWLS screening volunteers used these and many other criteria as well as their technical expertise and extensive experience. We have great confidence in those who did the work and we congratulate them on their perseverance and commitment.

Richard and Susan Johnson
